

Bridges and Overlooks

The site has several large ravines and many low wet areas that will need to be traversed by bridges. These Bridges shall be designed and engineered to meet code, standards, and long term structural integrity. The bridges will serve as observation areas as well.

The site design shall take advantage of overlook platforms where topography is steep and viewing a premium. These will be constructed along the Easy, Moderate and Difficult trails. These semi-circular decks shall vary in size with some large enough for classes and be designed and constructed with safety and long term reliability.
